                                                                                                                                                                                                                                                                                    Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match
                                                                                                                                                                                                                                                               Sequence 46529, Application US/09641528B
Patent No. 7026443
APPLICANT: Sidney, John
APPLICANT: Southwood, Scott
APPLICANT: Chesnut, Robert
APPLICANT: Chesnut, Robert
APPLICANT: Celis, Esteban
APPLICANT: Grey, Howard
TITLE OF INVENTION: INDUCING CELLULAR IMMUNE RESPONSES TO HUMAN PAPILLOMAVIRUS
TITLE OF INVENTION: USING PEPTIDE AND NUCLEIC ACID COMPOSITIONS
FILE REFERENCE: 2060.0100001
CURRENT APPLICATION NUMBER: US/09/641,528B
CURRENT FILLING DATE: 2000-08-15
FRIOR APPLICATION NUMBER: US 60/172,705
PRIOR FILLING DATE: 1999-12-10
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CURRENT APPLICATION DATA:

Patent NO. 6747137

GENERAL INFORMATION:

APPLICANT: Keith Weinstock et al

TITLE OF INVENTION: NUCLEIC ACID AND ANINO ACID SEQUENCES RELATING TO (
TITLE OF INVENTION: FOR DIAGNOSTICS AND THERAPEUTICS

FILE REFERENCE: 107196.132

CURRENT APPLICATION NUMBER: US/09/248,796A

CURRENT PILING DATE: 1999-02-12

PRIOR APPLICATION NUMBER: US 60/074,725

PRIOR APPLICATION NUMBER: US 60/096,409

PRIOR FILING DATE: 1998-08-13

NUMBER OF SEQ ID NOS: 28208
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            RESULT 94

CC protein is designated E6E7TetM, and comprises an E6 amino terminus (where residues 63 and 106 have been replaced with glycine) and an E7 carboxy CC terminus (where residues 24 and 26 have been replaced with glycine). CC E6E7TetM is representative of fusion proteins of the invention. The CC specification describes human papillomavirus E6 and E7 polypeptides, CC where the E7 polypeptide has mutations at any one or more of the amino caids corresponding to amino acids 24, 26 or 91 of the sequence given in AD044073 and the E6 polypeptide has no mutations or has mutations at any cone or more of the amino acids corresponding to amino acids corresponding to amino acids corresponding to amino acids of the sequence given in AD044072. The polypeptides of the invention are CC there sequence given in AD044072. The polypeptides of the invention are cancers, such as cervical cancer. The fusion proteins and nucleic acids cancers, such as cervical cancer. The fusion proteins and nucleic acids cancers, the fusion proteins are useful for generating immune responses against HPV. They are also useful for treating lower gastrointestinal tract cancers, e.g. anal cancer, and other cancers of the reproductive system, including penile and vulvar cancer.

                                                             CC polypeptides from human papillomavirus type 16 (HPV16). The fusion CC protein is designated B6E7PentM, and comprises an E6 amino terminus CC (where residues 63 and 106 have been replaced with glycine) and an E7 CC (arboxy terminus (where residues 24, 26 and 91 have been replaced with CC glycine). E6E7PentM is representative of fusion proteins of the CC invention. The specification describes human papillomavirus E6 and E7 CC invention. The specification describes human papillomavirus E6 and E7 CC polypeptides, where the E7 polypeptide has mutations at any one or more CC of the amino acids corresponding to amino acids 24, 26 or 91 of the CC sequence given in AD044073 and the E6 polypeptide has no mutations or has CC mutations at any one or more of the amino acids corresponding to amino CC (HPV)-associated cancers, such as cervical cancer. The polypeptides of CC the invention are useful for treating or preventing human papillomavirus CC (HPV)-associated cancers, such as cervical cancer. The fusion proteins and nucleic acids encoding the fusion proteins are useful for generating commune responses against HPV. They are also useful for treating lower CC gastrointestinal tract cancers, e.g. anal cancer, and other cancers of CC the reproductive system, including penile and vulvar cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              E6 protein; E7 protein; fusion protein; HPV16; HPV-associated cancer; cervical cancer; immune response; lower gastrointestinal tract cancer; anal cancer; reproductive system cancer; penile cancer; vulvar cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents a fusion protein,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New polypeptide comprising human papillomavirus E6 and E7 polypeptides, useful for treating or preventing human papillomavirus (HPV)-associated cancers, e.g. cervical cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      03-OCT-2002; 2002US-0415929P
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        02-OCT-2003; 2003WO-US031726.

PT Det	Determining a possible recurrence of a (pre-)cancerous growth in a patient infected with human papilloma virus (HPV), comprises incubating
PT imm	mple with an HPV E6 of E/ peptide and detecting a cell-median e response.
XX Die	Disclosure; Page 129-130; 132pp; English.
	man papilloma virus (HPV) or suspected of being infected with HPV, and
CC has	s or had a (pre-)cancerous growth on or around the cervix. The novel thod comprises incubating an E6 or E7 peptide of HPV with a sample from
CC the	e patient, and assaying the sample for a cell-mediated immune response ainst the peptide. The method is useful for determining the possibility
CC and	d preventing the recurrence of a (pre-)cancerous growth in a patient ifected with HPV or suspected of being infected with HPV. The HPV E6 or
CC the	E7 peptides are useful in immunotherapy for the preventing or reducing the risk of development of (pre-)cancerous growths. This sequence represents an HPV-16 protein of the invention

                                                                                                                                                                                     The invention relates to a novel method for determining the possibility of recurrence of a (pre-)cancerous growth in a patient infected with human papilloma virus (HPV) or suspected of being infected with HPV, and has or had a (pre-)cancerous growth on or around the cervix. The novel method comprises incubating an E6 or E7 peptide of HPV with a sample from the patient, and assaying the sample for a cell-mediated immune response against the peptide. The method is useful for determining the possibility and preventing the recurrence of a (pre-)cancerous growth in a patient infected with HPV or suspected of being infected with HPV. The HPV E6 or E7 peptides are useful in immunotherapy for the preventing or reducing the risk of development of (pre-)cancerous growths. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Determining a possible recurrence of a (pre-)cancerous growth in a patient infected with human papilloma virus (HPV), comprises incubating the sample with an HPV E6 or E7 peptide and detecting a cell-mediated

The specification describes human papillomavirus E6 and E7 polypeptides, where the E7 polypeptide has mutations at any one or more of the amino acids corresponding to amino acids 24, 26 or 91 of the sequence given in ADO44073 and the E6 polypeptide has no mutations or has mutations at any one or more of the amino acids corresponding to amino acids 63 or 106 of there sequence given in ADO44072. The polypeptides of the invention are useful for treating or preventing human papillomavirus (HPV)-associated cancers, such as cervical cancer. The fusion proteins and nucleic acids encoding the fusion proteins are useful for generating jamunume responses against HPV. They are also useful for treating lower gastrointestinal tract cancers, e.g. anal cancer, and other cancers of the reproductive system, including penile and vulvar cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New polypeptide comprising human papillomavirus E6 and E7 polypeptides, useful for treating or preventing human papillomavirus (HPV)-associated cancers, e.g. cervical cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human papillomavirus type 16.                            Methods have been developed for distinguishing a subset of human CC papilloma virus (HPV) that is associated with an increased risk of C papilloma virus (HPV) that is associated with an increased risk of CC papilloma virus (HPV) that is associated with an increased risk of CC (1) preparing a cervical sample to expose any HPV-16 E6 gene in the CC sample and determining if the base at position 350 of the E6 gene (see CC AAT94723 and AAT94724 for comparison) is T or G, where the presence of GC at position 350 is associated with an increased risk of developing CC cervical dysplasia or cervical cancer; and (2) preparing a cervical sample to expose any HPV-16 E6 protein in the sample and determining if the amino acid at position 83 of the protein (see position 90 in AAW35741 and AAW35742 for comparison) is Val or Leu, where the presence of Val at CC position 83 that is associated with an increased risk of developing CC cervical dysplasia or cervical cancer. The present sequence represents the variant protein sequence for HPV-16 E6. The 350G variant correlates well with Pap scores: 350T:350G ratios among 45 HPV16 samples were 10:4 CC or negative Pap scores; 4:2 for CIN I, 1:6 for CIN II; 2:9 for CIN III; CC 0:3 for cancer. (Updated on 25-MAR-2003 to correct PF field.)

                                                         The present sequence represents an E6E7 fusion protein, comprising wild type E6 and E7 polypeptides from human papillomavirus type 16 (HPV16). The specification describes human papillomavirus E6 and E7 polypeptides, where the E7 polypeptide has mutations at any one or more of the amino acids 24, 26 or 91 of the sequence given in ADO44073 and the E6 polypeptide has no mutations or has mutations at any one or more of the amino acids corresponding to amino acids 63 or 106 of there sequence given in ADO44072. The polypeptides of the invention are useful for treating or preventing human papillomavirus (HPV)-associated cancers, such as cervical cancer. The fusion proteins and nucleic acids encoding the fusion proteins are useful for generating immune responses against HPV. They are also useful for treating lower gastrointestinal tract cancers, e.g. anal cancer, and other cancers of the reproductive system, including penile and vulvar cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New polypeptide comprising human papillomavirus E6 and E7 polypeptides, useful for treating or preventing human papillomavirus (HPV)-associated cancers, e.g. cervical cancer.

                                                                                                                                                                                                   encodes a fusion polypeptide which is useful as a vaccine composition. The nucleic acid of the invention contains: a first nucleic acid encoding a polypeptide that promotes processing via the MHC class I pathway; a second sequence encoding a signal peptide; and a third sequence encoding an antigenic polypeptide. The DNA vaccine of the invention is useful for inducing or enhancing an antigen specific immune response, or to inhibit growth or prevent re-growth of a tumor expressing Human papillomavirus (HPV) B7 or E6 protein. The present amino acid sequence represents a human papillomavirus type 16 (HPV16) E6 protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                  antigen, a signal peptide, and a heat shoc for inducing or enhancing immune response tumor growth.
                                                                                                                                                                                                                                                                                                                                                                                                                New nucleic acid molecules encoding a fusion polypeptide comprising an antigen, a signal peptide, and a heat shock protein, useful as a vacci for inducing or enhancing immune response or for inhibiting or prevent

                                                                                                                                                                                                          The peptide is the sequence of the human papillomavirus HPV 16 E6 nucleoprotein. Peptides corresponding to regions (pref. epicopic regions) of HPV 16 E6 were synthesised by standard Merrifield synthesis. Examples of such peptides are E6 1-20, 8-20, 119-134 or 148-158. Compositions contg. these peptides, antibodies against the peptides, or recombinant cells contg. the gene encoding the immuno- genic peptides may be utilised in methods for inhibiting and treating HPV infection and tumour initiation and progression e.g. in the prevention or retardation of cervical warts and cervical carcinoma resulting from HPV infection.                                                                                                                                                                                                                 cancers and/or warts. The present sequence represents a human papillomavirus E6 protein containing two zinc finger motifs, the exemplification of the present invention
                                                                                                                                                                                                                                                  The present invention describes an agent used in the treatment or prophylaxis of a disease caused or exacerbated by MPV (mammalian parphylaxis of comprising a compound capable of reducing, inhibiting or otherwise decreasing the activity of a protein encoded by an MPV gene by facilitating disruption of a chelated metal cation domain present in the protein. An agent of the present invention can be used to treat cervical cancer or its HPV associated precursor lesions or other HPV associated
                                                                                                                                                                                                                                                                                                                                                                                      Polysulfide and dithionodisulfide agents, useful for the treatment prophylaxis of diseases caused by mammalian papillomavirus, are disruptors of a chelated metal cation domain in an MPV gene encoded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (MOLE-)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            03-SEP-1999;

                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes an isolated prepared human papillomavirus (C (HPV) epitope (I). (I) has antiviral activity, and can be used in vaccine production. Peptides and corresponding nucleic acid compositions from the gresent invention are useful for stimulating an immune response to HPV by C stimulating the production of CTL or HTL responses, specifically in the C treatment or prophylaxis of HPV infection, in persons who have not manifested symptoms e.g. genital warts or neoplastic growth. The peptides C can also be used in a tetramer staining assay to assess peripheral blood c mononuclear cells for the presence of antigen-specific CTLs following C exposure to a pathogen or immunogen, and as reagents to evaluate immune C compositions are useful for removing warts or treating HPV infections. The vaccine c compositions are useful for removing warts or treating HPV infections. C The epitopes for inclusion in an epitope-base vaccine may be selected c from conserved regions of viral or tumour-associated antigens, which c reduces the likelihood of escape mutants, also immunosuppressive epitopes that may be present in whole antigens can be avoided with the use of c epitope-base vaccines. An additional advantage is the ability to combine c selected epitopes (CTL and HTL) and to modify the composition of the control is that is safe and efficacious. AAB98391 to AAB98477 represent c invention

A complex of the invention has virucide and cytostatic activity, and may have a use as a vaccine. The complex is useful for identifying agents for treating or preventing a conditions involving altered level of the complex, e.g. human papilloma virus (HPV) infection, or cancer. The compositions, antibodies, vectors and methods are useful for treating such diseases. The sequences shown in ADF09500-ADF09583 represent proteins of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New purified complex comprising a first polypeptide and a second polypeptide, useful for identifying agents for treating/preventing condition involving altered level of the complex e.g. human papillo virus infection, or cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 158 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      N-PSDB;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              14-FEB-2002; 2002US-0356911P.

The nucleic acid of the invention contains: a first nucleic acid encoding a polypeptide that promotes processing via the MHC class I pathway; a second sequence encoding a signal peptide; and a third sequence encoding an antigenic polypeptide. The DNA vaccine of the invention is useful for inducting or enhancing an antigen specific immune response, or to inhibit growth or prevent re-growth of a tumor expressing Human papillomavirus (HPV) E7 or E6 protein. The present amino acid sequence represents a human papillomavirus type 16 (HPV16) E6 protein of the invention.

The invention relates to a novel nucleic acid composition useful as an immunogen. The composition comprises a combination of; a first nucleic competition acid vector comprising a first sequence encoding an antigenic polypeptide or peptide, and optionally, a second sequence linked to the first combination of the second nucleic acid vector encoding an anti-apoptotic polypeptide. CC When the second vector is administered with the first vector to a combination polypeptide is induced that is greater in magnitude and/or duration than an immune response to the antigenic polypeptide cor peptide is induced by administration of the first vector alone. CC minume response induced by administration of the first vector alone. CC suitable for introduction into a cell or an animal by particle composition; a pharmaceutical composition capable of inducing or composition; a pharmaceutical composition capable of inducing or composition; a pharmaceutical composition capable of inducing or composition an antigen specific immune response, comprising the particle commune response in a subject; increasing the numbers of CD8+ CTLs specific for a selected desired antigen in a subject; and inhibiting the growth of a tumor, hence it has cytostatic activity. This sequence represents ananti-apoptotic vector HPV cc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an antibody composition comprising a mixture of monoclonal antibodies that specifically bind to 86 proteins of human papilloma virus (HPV) strains 16, 18, 31, 33 and 45, where at least one of the monoclonal antibodies specifically binds to 86 proteins of at CC diagnostic kit (for detecting an HPV strains. Also included are a CC diagnostic kit (for detecting an HPV strains. Also included are a CC comprising the antibody composition above), a method of detecting an HPV CC comprising the protein in a sample, a method of detecting the presence of an oncogenic HPV 86 polypeptide in a sample (comprising a presence of an oncogenic HPV 86 polypeptide in a sample (comprising a first and a second binding partner is a PDZ domain protein and the second binding partner is a PDZ domain protein and the second binding partner is an antibody that specifically binds to the 86 proteins of at least three different oncogenic HPV strains). The antibody composition, kit, methods, and system are useful for diagnosing cancer, particularly cervical cancer. The present sequence is an HPV 86 protein.

                                                                                                                                                                                                                             밁
                                                                                                                                                                                                                                                                                  ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a method of producing a synthetic protein comprising an amino acid sequence that is at least 80% identical to a naturally occurring antigenic protein of a pathogen or tumor comprising chemically synthesizing two or more fragments, chemically ligating the C-cerminus of a fragment to the N-terminus of a neighboring fragment to produce the synthetic protein or its part and optionally repeating the C-cerminus of sequentially ligate a further neighboring fragment to beacond step to sequentially ligate a further neighboring fragment of composition comprising the protein and a method for treating or composition comprising the protein and a method for treating or the subject the protein or composition in a therapeutically effective amount. In producing a synthetic protein, the neighboring non-overlapping fragments are selected to comprise N-terminal cysteine or glycine residues. The naturally occurring protein is an HPV protein, e.g. E2, E6 or E7 protein from HPVIG, HPVIB, HPV31, HPV33 or HPV45. The composition further comprises an anti-CP40 antibody. The composition is seeful as a vaccine for preventing or treating HPV associated disease, such as confidence invention and an enthod on the method of the invention.

                                                                         The invention relates to a new polynucleotide comprising a multi-epitope CC construct comprising nucleic acids encoding the human papillomavirus CC (HPV) cytotoxic T lymphocyte (CTL) epitopes e.g., HPV16.E1.214, and that CC are directly or indirectly joined to one another in the same reading frame, a vaccine minigene. Also included are a vector comprising the CC multi-epitope construct, a polypeptide comprising an amino acid sequence encoded by the polynucleotide, a composition (comprising the CC polynucleotide, vector and/or polypeptide and a carrier), a cell CC (comprising the polynucleotide, vector or polypeptide), inducing an CC immune response against human papillomavirus virus (HPV) and making the CC polynucleotide, vector or polypeptide. The epitopes are derived from CC different strains of HPV and are from the E1, E2, E6 and E7 proteins. The cpitopes may be linked via a GP-anchor/spacer peptide. The order of the cpitopes in the vaccine protein are disclosed in the tables referred to CC polypeptide is useful in preparing a composition for inducing an immune CC different squame papillomavirus virus (HPV) and thus providing a composition and thus providing a CC defense against human papillomavirus virus (HPV) and thus providing a composition is an HPV protein used to derive epitopes for the vaccine of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       밁

                                                                                                                                                                                       Chesnut Chen Y,
    The invention relates to a new polynucleotide comprising a multi-epitope construct comprising nucleic acids encoding the human papillomavirus (HPV) cytotoxic T lymphocyte (CTL) epitopes e.g., HPV16 EEL 214, and that are directly or indirectly joined to one another in the same reading frame, a vaccine minigene. Also included are a vector comprising the multi-epitope construct, a polypepitode comprising anino acid sequence encoded by the nolymplacities.
                                                                                                                   New polynucleotide comprises a multi-epitope construct comprising nucleic acids encoding the human papillomavirus (HPV) cytotoxic T lymphocyte (CTL) epitopes, useful in preparing a vaccine against HPV.
                                                                                                                                                                                                                                                                                                             (CHES/)

The epitopes are derived from different strains of HPV and are from the El, E2, E6 and E7 proteins. The epitopes may be linked via a GP-anchor/spacer peptide. The order of the epitopes in the vaccine protein are disclosed in the tables referred to in the claims of the specification. The polynucleotide, vector or polypeptide is useful in preparing a composition for inducing an immune response against human papillomavirus virus (HPV) and thus providing a defense against human papillomavirus virus (HPV) and thus providing a defense is an HPV protein used to derive epitopes for the vaccine of the
The present invention relates to novel fusion protein for inhibiting or preventing cancer induced by human papillomavirus type 16 (HPVI6). The fusion protein comprises an E7 peptide sequence of human papillomavirus type 16, a translocating peptide for translocation and a peptide fragmen
                                                                                                                                                                                                         New fusion protein comprising E7 peptide sequence of human papillomavirus type 16, useful for inhibiting or preventing cancer, e.g. cervical or lung cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Vaccine; gene therapy; papillomavirus infection; uterine cervix tumor; cytostatic; gynecology and lung tumor; respiratory disease; E7 protein.

The fusion protein of the is useful as vaccines and for inhibiting or preventing human papillomavirus infection and canners such as cervical and lung The invention is useful in gene therapy. The present sequence in human papillomavirus type 16 (HPV16) E7 protein.
Methods have been developed for distinguishing a subset of hun papilloma virus (HPV) that is associated with an increased ris developing cervical dysplasia or cervical cancer. The methods (1) preparing a cervical sample to expose any HPV-16 E6 gene is sample and determining if the base at position 350 of the E6 c

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAT94723 and AAT94724 for comparison) is T or G, where the presence of G at position 350 is associated with an increased risk of developing cervical dysplasia or cervical cancer; and (2) preparing a cervical sample to expose any HPV-16 E6 protein in the sample and determining if the amino acid at position 83 of the protein (see position 90 in AAW35741 and AAW35742 for comparison) is Val or Leu, where the presence of Val at position 83 that is associated with an increased risk of developing cervical dysplasia or cervical cancer. The present sequence represents the reference protein sequence for HPV-16 E6. The 350G variant correlates well with Pap scores: 350T:350G ratios among 45 HPV16 samples were 10:4 for negative Pap scores; 4:2 for CIN I, 1:6 for CIN II; 2:9 for CIN III; 0:3 for cancer. (Updated on 25-MAR-2003 to correct PF field.)
The invention relates to a new DNA sequence encodes an E6 or E7 fusion protein of HPV, where at least 20% of the original codons are replaced by codons which lead to enhanced translation in a mammalian cell, containing

The invention is used as a vaccine for the prevention or treatment of an HPV infection or a neoplasm associated with HPV infection. This sequence represents the human papillomavirus-16 (HPV16) EE6T-protein sequence of the invention
  The sequences of the E6 papillomavirus (HPV) 16 proteins in AAR63865-66,

The present sequence represents a fusion protein, comprising E7 and E6 polypeptides from human papillomavirus type 16 (HPV16). The fusion protein is designated E7E6TetM, and comprises an E7 amino terminus (where residues 24 and 26 have been replaced with glycine) and an E6 carboxy terminus (where residues 63 and 106 have been replaced with glycine). B7E6TetM is representative of fusion proteins of the invention. The specification describes human papillomavirus E6 and E7 polypeptides, where the E7 polypeptide has mutations at any one or more of the amino acids corresponding to amino acids 24, 26 or 91 of the sequence given in AD044073 and the E6 polypeptide has no mutations or has mutations at any one or more of the amino acids corresponding to amino acids corresponding to amino acids 63 or 106 of
                                                                                                                                                                                                                                 New polypeptide comprising human papillomavirus E6 and useful for treating or preventing human papillomavirus cancers, e.g. cervical cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         sequences were used for HPV infection diagnosis; expression of E6 and diagnostic for cervical cancer or pre- malignant states. The polypeptides of the invention are useful for treating or preventing human papillomavirus (HPV)-associated cancers, such as cervical cancer. The fusion proteins and nucleic acids encoding the fusion proteins are useful for generating immune responses against HPV. They are also useful for treating lower gastrointestinal tract cancers, e.g. anal cancer, and other cancers of the reproductive system, including penile and vulvar cancer.

polypeptides from human papillomavirus type 16 (HPV16). The fusion protein is designated E7E6PentM, and comprises an E7 amino terminus (where residues 24, 26 and 91 have been replaced with glycine) and a carboxy terminus (where residues 63 and 106 have been replaced with glycine). E7E6PentM is representative of fusion proteins of the invention. The specification describes human papillomavirus E6 and E

The present sequence represents a fusion protein,

The polypoptides of the invention are useful for treating or preventing human papillomavirus (HPV)-associated cancers, such as cervical cancer. The fusion proteins and nucleic acids encoding the fusion proteins are useful for generating immune responses against HPV. They are also useful for treating lower gestrointestinal tract cancers, e.g. anal cancer, and other cancers of the reproductive system, including penile and vulvar cancer.
                                                           Virus-like particle vaccines containing dengue as core for carrier, applicable in preventives like cervical cancer and viral diseases.

Different types of dengue virus can be used to repeatedly produce efficient immune response thereby strengthening the body's immune system against the pathogen that contains such antigen. Human papillomavirus (HPV) vaccines were prepared by using a gene-expressing system using of the full-length dengue virus cDNA clone (pRS/FLD2). The recombinant virus vectors were transfected into baby hamster kidney (BHK) cells to enable the screening of BHK-21 Tet-off cell lines. This sequence corresponds to the HPV type 16 E7 protein whose encoding gene is used as the gene of interest in the recombinant replicon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     sequence for preM protein of dengue virus and also includes elements of e.g. the non-coding region in the whole of the 5'-end, the coding region of the front 20 amino acids in the C protein, and the coding region of NS1 protein signal, coding regions of all non-structural proteins. The obtained vaccines are useful in producing preventives or/and remedies for cancer like cervical cancer and viral diseases. Such vaccines can efficiently express antigen in infected cells, which is because dengue

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention provides a virus-like particle (VLP) vaccine which contains dengue virus (DEN) recombinant replicon as its core. The DEN replicon contains exogenous nucleotide sequences such as human papillomavirus (HPV) antigen proteins, immune regulators or combination of HPV antigen and immune regulators. The invention is useful for producing a drug for the prophylaxis and treatment of cancer or viral infection. The present sequence is a human papillomavirus oncoprotein.
                                           Recombinant virus vectors encoding human papillo treating and vaccinating against HPV infections them, such as cervical cancer.
